Equity Associate
Toward a circular economy

The global economy as it currently operates demands more of the world’s resources than Earth can sustain. This challenge summons adaptations and new solutions. Among these, the concept of a circular economy, which maximizes effective use of resources and minimizes waste, has emerged as an important framework to inform business leaders and investors.

The circular economy offers potential to improve planetary health and to dramatically improve the natural resource intensity of the global economy. Human production and consumption have already exceeded Earth’s capacity to provide and replenish natural resources in key areas, due in large part to linear “take, make, waste” approaches to production, consumption, and disposal.

These linear approaches are linked to high levels of emissions, waste, and other environmental challenges, as well as increasing business risks and uncertainties.

In contrast, circular economy approaches focus on effective design; extended product life spans through reuse, repair, and recycling; and more benign decomposition.

These circular approaches have direct links to new products, practices, and business models, offering possibility in some settings for enhanced growth, reduced risk, and improved financial returns.

Investors have the opportunity to identify successful business innovations in this area, with potential for strong growth, attractive returns, and environmental benefits.

Understanding the fundamental operating context for specific companies, products, and production processes improves this analysis.

Companies that are pursuing circular economy strategies include Ball Corporation, Eastman Chemical, Levi Strauss, Lyft, United Rentals, Apple, and ASML.

We are glad to share these observations from Putnam’s Sustainable Equity team, as we work to assess the vital developments in this area.
Putnam’s approach to sustainable equity investing

Our research process for Putnam’s sustainable equity strategies focuses on the links between sustainability and long-term business fundamentals. Specifically, we seek to identify companies whose businesses are made stronger by their commitments to relevant sustainability issues. For the Putnam Sustainable Leaders portfolio, we invest in companies that benefit from leadership in financially material sustainability areas. For the Putnam Sustainable Future portfolio, we invest in companies that are solving key sustainability challenges, leading to opportunities for growth and positive impact.

Circular economy resources

Our research on the investment implications of the circular economy has benefited tremendously from the work of many others, including these leading organizations:

- Stockholm Resilience Centre
- Ellen MacArthur Foundation
- The Biomimicry Institute
- Platform for Accelerating the Circular Economy (PACE)
- World Resources Institute
- Intergovernmental Panel on Climate Change (IPCC)
There is strong scientific consensus regarding the deteriorating health of the planet and the seriousness of climate change. Human consumption and production patterns have had significant impact on planetary health and have already exceeded Earth’s capacity on several important dimensions. Current rates of resource use would require approximately 1.75 Earths to maintain healthy ecosystem functions and regenerate needed resources. Consequences of climate-related risks like extreme weather, drought, and storms have an amplified impact on economically disadvantaged communities, increasing inequities of health and wealth.

Against this sobering backdrop, the circular economy offers potential for valuable and vital improvements. As Dame Ellen MacArthur notes, “If we can get to an economic model that is restorative and regenerative . . . we have an economy that can run forever.”

More than 100 billion tons of resources enter the economy every year, from metals, minerals, and fossil fuels to organic materials from plants and animals. Of this, just 8.6% gets recycled and used again. The utilization of resources has tripled since 1970 and could double again by 2050 if “business as usual” continues. Importantly, resource use continues to outpace population growth, despite economies of scale in some settings, improvements in certain recycling rates, and rapid growth of the service economy. This implies the overall material intensity of economic growth worldwide remains high and that most businesses are still relying on more linear “take, make, waste” models.

Adapting business models to be less resource intensive creates opportunity for tremendous environmental and economic benefit.
**Linear business model**

This linear approach is analytically tidy and familiar to many who have studied neoclassical economics. But it stands in clear contrast to all we know about the more complex and interconnected real-life structures of networks, ecosystems, and social structures — the essential systems that support and influence most long-term business results.

---

**TAKE**
Companies extract raw materials and resources from the natural environment.

**MAKE**
These materials are used to produce products for consumption, with varying levels of resource and labor intensity, along with waste creation.

**USE**
Customers use the product, sometimes for a short product life span.

**WASTE**
Products are ultimately discarded, creating material waste and sometimes also contaminants with long-term environmental impact.

---

Source: Ellen MacArthur Foundation.
SECTION 2
What is the circular economy?

A healthy planet supports all human activity, but the degradation of natural systems is becoming more evident. As a potential solution, the “circular economy” refers to an economic model that emphasizes cycles of reuse, recycling, and repair versus a linear model of extraction, consumption, and disposal.

In a circular economy, products are designed with goals of efficient resource use, extended product life, and improved ability to repair, recycle, and reuse materials. Pollution and waste are minimized, products and materials are used longer, and natural systems are more able to maintain health and regenerate. While some of these design challenges are significant, a circular economy approach presents tremendous potential for economic growth to be decoupled from ever-increasing natural resource use, including the related negative impacts on environmental and social systems.

Within the context of increasing resource constraints, global warming, and still-rising worldwide demand, circular economy design principles and business structures offer immense opportunities for the creation of new processes, practices, and businesses with meaningful benefits. The Platform for Accelerating the Circular Economy has identified 21 key solutions that offer potential to decrease resource extraction by 28% and to improve greenhouse gas emissions by 39%.10

Circular economy

While the circular economy is often presented as a single loop, as fundamental analysts, we aim to understand all parts of business models. Therefore, we find it is helpful to illustrate the “circles within the circle” to uncover more functionally specific insights. For example, before a product is even created, we can design for modularity, reuse, and ultimate decomposition. Sharing economy solutions, rentals, and resale offerings focus on extending the useful life of products within the consumption phase. And repair and recycling practices create different flows between the inputs phase and ultimate decomposition or disposal, lowering ongoing use of raw materials and waste rates.
Circular economy model

The circular economy offers multiple intervention points to improve resource use and minimize waste through thoughtful design and production, extended product and component uses, and more benign decomposition.

Sources: Putnam Investments, Ellen MacArthur Foundation.
SECTION 3

Evolving business models

Business leaders are recognizing the opportunities that circular economy approaches can present. These opportunities vary across different business types, so understanding business fundamentals can help investors to identify the areas of greatest potential benefit.

When we begin to translate from a systems-level understanding of the circular economy to specific business models, patterns emerge that help to improve our analytical understanding.

For many businesses, in the short term there is still a disconnect between market price and the true cost of inputs, waste rates, and environmental consequences, due to separations across time and space. In a world of infinite forests, recycling cardboard might appear complicated and costly. In a world of infinite affordability, even rarely used equipment might warrant plenty of customers.

However, business innovation around circular economy principles is accelerating as the finite supply of raw materials, the long-term costs of waste and toxicity, and the interconnections between economic, environmental, and social systems become more apparent. Increasingly, business leaders are recognizing the systemic risks and opportunities that impact their operations, such as potential inflation, materials scarcity, elevated operating costs, and higher long-term liability.

Consequently, companies are decreasing reliance on raw materials, designing better for repair and reuse, and creating new business models that allow them to benefit from extended product lives. Importantly, these developments are not only risk management exercises; they are also creating opportunities for innovation in products, services, and processes, along with potential financial returns.

Before diving into some specific examples of business evolution, it’s important to note several universal ideas that go beyond any particular product or process. As students of complex adaptive systems and the field of biomimicry, we observe several key design principles that are embodied in natural systems and deeply embedded in the concepts of circular economy. Biomimicry luminary Janine Benyus observes, “The answers to how to live sustainably on our planet are all around us … we are not the first to manufacture. Life solves its problems with well-adapted designs, life-friendly chemistry, and smart material and energy use.” It is easy to observe the contrast between these descriptions of natural systems design and many common business practices.
Use less. Natural systems illustrate an approach that is material and energy efficient. A honeycomb creates the most usable space with the least materials intensity. A squirrel stores enough nuts for the winter, not all the nuts she can find.

Use clean. Natural systems use “clean chemistry,” where components return back into usable raw materials at the end of their lifecycles. There are no landfills in a meadow or toxic waste sites in a forest.

Use smart. Natural systems make the most of modular components, integrating development and growth. Ants build out the colony structure as population grows. Trees branch above as their roots stretch below. When any one portion is disabled or out of sync with the whole, it can be repurposed or recycled without ruining the rest.

Adjust, adapt, evolve. Natural systems are attuned to their local environments, changing over time as conditions warrant. Sunflowers follow the arc of the day, and wildebeests follow the rains. Feedback loops are robust, and resilience is embodied through variation and diversity, redundancy, and decentralization.12

These universal principles are relevant across almost all business settings, and we can see evidence of these strategies in a wide range of companies and products.

“...The answers to how to live sustainably on our planet are all around us ... we are not the first to manufacture. Life solves its problems with well-adapted designs, life-friendly chemistry, and smart material and energy use.”

JANINE BENYUS
Co-founder, Biomimicry Institute
More specifically, we identify three major types of production models, as detailed in the following table. While there are considerable connections between these categories, each type of production model lends itself to a particular form of solution. Products that are derived primarily from raw materials can benefit from a focus on recycling. Products that are more complicated, involving high energy and high materials intensity, can benefit from a focus on extended product life. And highly engineered technological products can benefit from a focus on modular design, repair, and reuse. All of these forms of innovation offer opportunities for investors to identify corporate leadership and solutions providers, the key focus areas for the Putnam Sustainable Leaders and Putnam Sustainable Future portfolios.

SECTION 4

Evolving production models

The three types of production models described here can be found across a range of sectors and products, and we can identify a number of companies whose strategies illustrate circular economy practices. In many cases, these practices are in the early days of their development, with opportunities to extend their scope and improve their environmental and financial effectiveness over time.

Packaging materials

Packaging materials like boxes, bottles, and cans are examples of products with high raw materials content where a recycling-focused business model can have meaningful impact. Paper and paperboard, plastics, glass, and metals together represent almost half of all municipal solid waste in the United States, and packaging and containers alone represent about 28% of total waste volumes.13

Within this area, aluminum packaging presents some important attributes that differentiate it from other materials. Aluminum beverage containers have a recycling rate of nearly 70% globally and 50% in the United States, and the average aluminum can contains at least 70% recycled content.14 The physical properties of aluminum are major contributors to these high rates: it is lightweight and therefore relatively easy to transport and maintains very high material integrity when recycled. This compares with more limited material properties for plastics, where most recycled content needs to be downcycled into less-valuable products. This is one key factor leading to lower recycling rates of approximately 9% for plastics.15

Ball Corporation is a company that has focused its corporate strategy on aluminum packaging and its attractive recycling profile. In 2021, 86% of Ball’s revenue was generated from the sale of products that are manufactured with recycled materials, are reusable, or recyclable, including aluminum beverage cans, bottles, cups, and aerosol cans. These sustainability attributes are increasingly important to Ball’s customers, which is contributing to revenue growth, and the use of recycled material has potential long-term cost benefits as well.16

Ball Corporation is a company that has focused its corporate strategy on aluminum packaging and its attractive recycling profile.
Beyond aluminum, many plastics and composites packaging companies are improving the materials they use and the recyclability of their offerings, in part due to strong customer demand. Major packaged goods companies like Unilever, AB InBev, and Procter & Gamble all have major initiatives that focus on increased recyclability, increased use of recycled materials, and broader system change. And major retailers like Walmart and Amazon have programs with suppliers to reduce total packaging volumes and waste to landfill. Eastman Chemical Company has developed a molecular recycling process that allows for recycling of certain plastics that were previously hard or impossible to address through mechanical recycling approaches. Additionally, dozens of new approaches to packaging using biomaterials like mycelium and cellulose offer potential for future advancement. All of these innovations have potential to align with rising demand and benefit from improving economics over time.

Fashion and textiles

Textiles and fashion are examples of products with high resource and energy intensity, where extending product lives can have a meaningful environmental and economic impact. Business models that focus on long-lasting products, resale, or rentals are all developing quickly.

Textile creation is responsible for an estimated 10% of global greenhouse gas emissions, and just 12% of material used for clothing is recycled. About 60% of textiles are made using fossil fuel-based synthetic fibers like polyester, and natural fibers like cotton are very water intensive to produce. The average closet in the United States is estimated to contain about 25 unworn items, and the average clothing item is worn just 7 to 10 times before being discarded. This backdrop presents an opportunity to decrease unworn items, extend use of existing items, and divert waste from landfill through repair, reuse, and resale.

Levi Strauss is an example of a company whose brand focuses on durability and long-term appeal, as opposed to many “fast fashion” approaches. More recently, the company has become more active in resale and repair offerings, including its SecondHand vintage resale marketplace. Levi’s also has made significant investments in improving materials and resource intensity for its products, contributing to improved profitability and better environmental impact. For example, the company’s cottonized hemp material requires less water and fewer pesticides, making the finished products about 20% less water intensive. Though these newer businesses and product offerings are still small, they have potential to engage customers, create new revenue streams, and improve overall environmental impact for the products involved.
A number of fashion and textile companies are focused on improvements in their product sourcing, from both an environmental and social standpoint. For example, H&M has committed to 100% recycled or sustainably sourced materials by 2030, and Allbirds highlights its materials integrity as a core product attribute.

Additionally, a range of fashion resale and rental businesses have developed to meet rising demand, including thredUP, Poshmark, Depop (owned by Etsy), Rent the Runway, and The RealReal. In addition to improving the overall volume of textiles in circulation, buying secondhand reduces the carbon footprint per item by 82%, while extending product life and usually offering more affordable options for consumers. While some of these businesses have not yet reached profitable operating models, the secondhand fashion market is expected to double in the five years ending 2025, and 33 million consumers bought secondhand for the first time in 2020, indicating strong and growing demand. Additionally, technological advances can make these models less labor and cost intensive, improving long-term economic prospects.

**Capital goods**

Capital goods like cars and commercial equipment are examples of products with high resource and energy intensity where extending product lives can have a meaningful environmental and economic impact. Business models that focus on product-as-a-service, rentals, and shared use are all developing quickly.

Equipment manufacturing of all sorts consumes over 7 billion tons of raw materials globally each year, and the demolition of long-lived assets represents 23% of global waste annually. Additionally, many types of capital goods are not in constant use. For example, the average passenger car sits idle 95% of the time, and many types of heavy equipment and specialized tooling are subject to long periods of downtime due to inconsistent need or unexpected repair and maintenance requirements. The materials intensity, cost of ownership, and underutilization of capital equipment all present opportunities for more effective use of these assets.

Ridesharing companies like Lyft and Uber are examples of companies that are creating businesses centered around more effective use of capital equipment. A car used for rideshare services travels three to five times as many miles annually as a typical personal vehicle, and availability of rideshare services is estimated to have decreased overall individual car ownership in North America by as much as 9 million units. Though the early stages of these businesses’ development have raised important questions about congestion, safety, and employment models for drivers, these metrics on auto ownership and use indicate that ridesharing could result in significantly lower need for individual auto ownership over time. If so, we could see more dramatic improvements in utilization of those resources, decreasing resource use for auto production and production-related emissions while potentially enhancing convenience and total cost of transportation for customers.
Equipment rental companies like United Rentals and Ashtead also offer more effective fleet utilization for everything from scissor lifts to specialized power tools. Rental models allow the equipment to be used more frequently and maintained more consistently, offering customers cost savings, ease, improved safety, advanced features, and greater access to the equipment they need.

Shared service business models are proliferating beyond traditional capital goods as well. Airbnb and VRBO (owned by Expedia) offer similar services for short-term housing and travel, while cloud computing companies like Microsoft Azure, Amazon AWS, and Google Cloud Platform provide computing access on an as-needed basis. In all of these cases, the more effective use of long-term, capital-intensive assets is a key contributor to the economic success of the businesses.

**Electronics**

Electronics are examples of high complexity products that rely on rare materials, are difficult to recycle, and often have useful product lives that are relatively short. For these types of products, improving repair and reuse practices can have significant environmental and economic impact. Business models that focus on design for reuse or modular recovery are advancing, offering opportunity for risk mitigation and improvements in potential long-term financial returns.

Electronics are less materials intensive than some other product types, but the profile of those materials is both costly and risky. E-waste represents 2% of municipal solid waste but makes up 70% of the hazardous waste in landfills, including mercury and flame-retardant chemicals. The value of e-waste is estimated to be about $62 billion annually, mainly in metals like copper and gold, though this value could be much higher if the materials involved remained embedded in usable components. About 20% of electronics are recycled globally; this relatively low rate is due in part to recycling processes that are complicated and require a range of expertise and infrastructure.

This backdrop implies tremendous potential value in extending capacity for electronics repair and reuse, both at the finished product level and at the subcomponent level. To pursue these opportunities, business processes for product design, product lifecycle management (including modular components and service models), and refurbishment potential are all important.

A number of hardware companies have developed serious strategic approaches to product circularity, including Apple, which has accelerated product buyback programs and pledged to use 100% recycled materials by 2030, a very ambitious target. For example, the iPhone 13 already uses 98% recycled rare earth elements and 35% recycled plastic. In addition to clear environmental benefits, these investments could help Apple to mitigate risks of supply shortages and cost increases, and they open new avenues for offering customers service-based offerings instead of (or in addition to) hardware-based offerings.

ASML, a leading provider of semiconductor manufacturing equipment, uses modular design and an active focus on service and refurbishment to support high levels of productivity and long useful life of equipment, two attributes that are vital to their customers. Because of this focus, 90% of all ASML systems ever made are still in use; the company has a 77% recycled materials rate; and new offerings can certify restored components at “as new” quality levels. All of these elements lead to improved environmental intensity, ability to offer productivity-based contract terms to customers, and related financial benefits for both ASML and its customers.
Circular economy opportunities for high complexity products are not limited to the technology sector. Health care equipment companies like Philips have developed combined product and service models for imaging systems like MRI equipment, where the company manages equipment repairs and maintenance, allowing for better alignment of interests between producer and customer. When aircraft are retired for Boeing, Airbus, and related companies, over 90% of the overall content is reused or recycled throughout the system of suppliers, manufacturers, and customers. Approximately 40%–50% of this value is in highly technical components that can be repaired and reused.33

Conclusion
The circular economy offers potential to enhance planetary health and to dramatically improve the natural resource intensity of the global economy.

Business approaches that focus on effective design; extended product life spans through reuse, repair, and recycling; and more benign decomposition have the opportunity to reduce risks, improve environmental outcomes, align with customer demand, and potentially enhance long-term prospects for growth and financial returns.

Investors have the opportunity to identify successful business innovations in this area by better understanding current resource intensity of key products and processes, recognizing areas for potential solutions, and analyzing individual company efforts to contribute to the circular economy.

Beyond all these strategic and tactical benefits, focusing on the circular economy is a way for investors and business leaders to realign our activity with the needs of the world we inhabit. As more effective stewards of the long-term health of our systems, societies, and planet, we can reconnect investing with the world it is intended to serve, helping to create conditions for all to thrive.
The circular economy is a key theme within Thriving Planet, one of the major categories represented in our Investing for a Thriving World map. All the themes represented here inform our fundamental research, and in turn are informed by emerging trends observed in our company-specific analysis. This forward-looking framework contributes to our investment decision-making, as we seek companies that are strengthened by leading or providing solutions in essential sustainability areas.

12 These summaries are abstracted from materials of the Biomimicry Institute and related writing from Katherine Collins, including The Nature of Investing: Resilient Investment Strategies Through Biomimicry, Bibliomotion/Routledge, 2014.
27 This figure reflects a broad-based definition of capital equipment, intending to measure all physical hardware, including technological, industrial, and consumer capital goods; Equipment Circular Action Agenda, https://pacecircular.org/action-agenda/capital-equipment.
This material is prepared for informational purposes only and is not intended as an offer or solicitation for the purchase or sale of any financial instrument, or any Putnam product or strategy. The information presented in this report has been developed internally and/or obtained from sources believed to be reliable; however, Putnam Investments does not guarantee the accuracy, adequacy, or completeness of such information. Unless otherwise noted, Putnam is the source of all data. Any references to securities, asset classes and financial markets are for illustrative purposes only and are not intended to be, and should not be interpreted as, recommendations or investment advice. This material does not take into account any investor’s particular investment objectives, strategies, tax status, or investment horizon. Past performance is not a guarantee of future results. As with any investment there is a potential for profit as well as the possibility of loss.

The inclusion of holdings information should not be interpreted as a recommendation to buy or sell or hold any security. The securities identified do not represent all the securities purchased, sold, or recommended for client accounts. It should not be assumed that any investment in these securities was, or will prove to be, profitable, or that the investment decisions we make in the future will be profitable. Allocations and security selection are subject to change. Past performance is no guarantee of future results.

Consider these risks before investing: The value of investments in the fund’s portfolio may fall or fail to rise over extended periods of time for a variety of reasons, including general economic, political, or financial market conditions; investor sentiment and market perceptions; government actions; geopolitical events or changes; and factors related to a specific issuer, geography, industry, or sector. These and other factors may lead to increased volatility and reduced liquidity in the fund’s portfolio holdings.

Growth stocks may be more susceptible to earnings disappointments and the market may not favor growth-style investing. Investments in small and midsize companies increase the risk of greater price fluctuations. From time to time, the fund may invest a significant portion of its assets in companies in one or more related industries or sectors, which would make the fund more vulnerable to adverse developments affecting those companies, industries, or sectors. International investing involves currency, economic, and political risks. Investing with a focus on companies whose products and services produce positive environmental, social, and economic development impact may result in the fund investing in certain types of companies, industries, or sectors that underperform the market as a whole. In evaluating an investment opportunity, we may make investment decisions based on information and data that is incomplete or inaccurate. Due to changes in the products or services of the companies in which the fund invests, the fund may temporarily hold securities that are inconsistent with its sustainable investment criteria.

Our investment techniques, analyses, and judgments may not produce the outcome we intend. The investments we select for the fund may not perform as well as other securities that we do not select for the fund. We, or the fund’s other service providers, may experience disruptions or operating errors that could have a negative effect on the fund. You can lose money by investing in the fund.

As of 3/31/22, Ball, Unilever, Walmart, Amazon, Levi, Etsy, Microsoft, Apple, and ASML represented 1.04, 1.00, 2.66, 4.66, 0.69, 0.42, 8.26, 8.12, and 1.00 % of Putnam Sustainable Leaders Fund assets. As of the same date, Ball, ThredUp, Etsy, Lyft, and ASML represented 1.39, 0.42, 0.78, 1.28, and 1.30% of Putnam Sustainable Future Fund assets. Unilever, Ab InBev, Proctor & Gamble, Eastman Chemical Company, H&M, Allbirds, Poshmark, Rent the Runway, The RealReal, Uber, United Rentals, Ashtead, Airbnb, Expedia, Alphabet, Philips, Boeing, and Airbus were not held in either portfolio.

The companies presented as investment examples represent the positions deemed most relevant to the applicable ESG investment theme being discussed. Company examples were selected without regard to whether such industries, or relevant securities, were profitable and are intended to help illustrate our fundamental research process. A security may be selected for a portfolio based on factors other than the ESG themes highlighted herein, and the inclusion of company information should not be interpreted as a recommendation to buy or sell or hold any security. It should not be assumed that investment in the securities mentioned was or will be profitable.
Investors should carefully consider the investment objectives, risks, charges, and expenses of a fund before investing. For a prospectus, or a summary prospectus if available, containing this and other information for any Putnam fund or product, call your financial representative (or call Putnam at 1-800-225-1581). Read the prospectus carefully before investing.
