***Increasing risk-aversion created a more challenging market environment in February and March.***

***Favorable global interest-rate positioning and mortgage-credit holdings aided the fund's relative performance, while currency strategies detracted.***

***A supportive international environment may provide further opportunities to pursue global interest-rate and currency strategies.***

## **What was the fund's investment environment like during the first quarter of 2018?**

Following a strong start in January, the majority of risk-driven asset classes declined in February and March, as market volatility and investor risk-aversion returned after being largely absent from the market for the past two years.

At the onset of 2018, stocks and credit-sensitive bonds performed well amid an improving outlook for global economic growth, positive sentiment surrounding U.S. tax reform, and continued strength in corporate earnings. The yield on the benchmark 10-year U.S. Treasury rose by 0.26% in January, ending the month at 2.72%, as optimism about a synchronized global recovery spread.

The environment shifted in late January due to interest-rate jitters, collapsing strategies predicated on market volatility remaining low, and uncertainty about inflation expectations and a corresponding response from the Federal Reserve. Stocks reached correction territory in February, declining by roughly 12% from their January highs, with declines worsening when the Trump administration announced that it would impose tariffs on imports of steel and aluminum, sparking widespread fear of a trade war.

The yield on the 10-year Treasury posted its largest quarterly increase since the end of 2016. Data showed wages and consumer prices rose in January, encouraging more investors to sell government bonds and driving the yield on the 10-year Treasury more than half a percentage point higher in less than two months. But the rise in yields stalled in March. Strong January wage data were revised

lower in the following month's labor report. Subsequent weaker-than-forecast inflation data suggested the tax cuts were unlikely to spur growth that matched the move in market expectations. Rising bond yields also attracted buyers. After reaching 2.94% on February 21 — its high for the period — the 10-year yield finished the quarter at 2.74%.

Heightened risk-aversion and rising yields pushed most credit-sensitive and U.S. government fixed-income categories into the red for the quarter. Among the bright spots were foreign developed-market sovereign bonds, which advanced 4.42% in U.S.-dollar terms, and floating-rate bank loans, which gained 1.45%.

The U.S. dollar weakened against other major currencies during the quarter, partly dampened by concerns about U.S. trade policy with China and the risk of a global trade war. Also weighing on the dollar was a global economic upswing that has encouraged central bankers in Europe and Asia to take the first steps toward normalizing monetary policy after years of expansive support. Indications that the European Central Bank [ECB] and the Bank of Japan are on course to phase out their stimulus programs and eventually raise interest rates boosted the yen and the euro by 5.9% and 2.7%, respectively, against the dollar.

**The fund performed about in line with its benchmark, the Bloomberg Barclays Global Aggregate Bond Index, for the quarter. Which holdings and strategies aided relative performance?**

Our interest-rate positioning was the biggest contributor for the quarter. We continued to de-emphasize interest-rate risk by keeping the fund's duration shorter than that of the benchmark. This strategy positioned the fund to benefit if market interest rates rose, which is exactly what happened in the United States. Tactical positioning in Europe also aided performance. Most notably, a short position in the United Kingdom during the first half of the quarter proved beneficial as bond yields there rose. A shift to long exposure in the United Kingdom during the second half of the quarter also helped, as rates trended lower during that time.

Our mortgage credit holdings provided a further boost versus the benchmark, led by investments in mezzanine commercial mortgage-backed securities [CMBS]. We held CMBS that were issued between 2011 and 2014, and the yield spreads for these bonds stayed in a fairly tight range versus widening spreads in the broader market. [Bond prices fall as spreads widen.]

Strategies targeting prepayment risk modestly aided results this period. Our positions in reverse-mortgage interest-only [IO] securities continued to benefit from regulatory changes announced by the Department of Housing and Urban Development in August. Investors believe the new regulations will reduce the incentives for holders of such mortgages to refinance while at the same time bolstering secondary market demand for reverse-mortgage IOs.

Higher longer-term Treasury yields aided the performance of our positions in agency interest-only collateralized mortgage obligations [IO CMOs]. Rising mortgage rates and constrained lending activity due to stringent bank underwriting standards resulted in a subdued rate of mortgage refinancing. As a result, prepayment speeds on the mortgages underlying our IO CMO positions stayed below market expectations.

**What about detractors?**

Our currency strategies worked against relative performance in the first quarter. Our positioning was hampered by short exposure to the euro, to the Japanese yen, and to the British pound, all of which strengthened against the U.S. dollar. Long exposure to the weakening Australian dollar also dented results. By contrast, a short position in the Swedish krona proved additive and partially offset the overall negative impact of our strategies.

**What is your near-term outlook?**

Recent U.S. and global economic data have been stronger than most market observers were expecting several months ago, especially given the fact that interest rates have risen. Despite this strength, we think it is unlikely that the global economy will overheat at this stage of the business cycle and spark a sustained rise in inflation. As an example of our view, we believe the U.S. unemployment rate, which has held at 4.1% since October — its

lowest level since December 2000 — results partly from demographic and structural factors. Consequently, we don't think the current level of employment will cause the economy to overheat.

During the quarter, we also saw a stabilizing dynamic at work in the markets. With bond yields trending higher, on days when market-moving economic data were released, bond investors would react and the yield curve would adjust, helping to dampen the impact on risk-sensitive assets.

Treasury yields also stabilized, plateauing in March and ending the quarter slightly below where they peaked. We think yields may continue to drift higher over the course of 2018, as rate normalization continues.

### Given this outlook, what market sectors do you find to be most attractive?

Surprisingly, as bond yields rose during the quarter, spreads remained relatively stable. [Spreads are the yield advantage offered by riskier types of bonds over comparable-maturity Treasuries.] Spreads for investment-grade and high-yield corporate credit, as well as mortgage credit, finished the period near their lows for the current market cycle. We think this is justified by the fundamentals underlying these market sectors, namely solid economic growth, rising corporate profits, and a strong housing market. We believe the fundamental backdrop continues to support risk-taking in these sectors, and we think this is particularly true in structured mortgage credit. As a result, we continue to have a positive outlook for securitized mortgage products, such as CMBS, agency IO CMOs, and non-agency residential mortgage-backed securities.

Overseas, the eurozone economy had its best year in a decade during 2017, growing at a 2.4% annual rate, and the jobless rate fell to its lowest level since 2008. The ECB said it would continue purchasing government bonds

### Putnam Global Income Trust (PGGYX)

Annualized total return performance as of 3/31/18

Class Y shares Inception 10/4/05	Net asset value	Bloomberg Barclays Global Aggregate Bond Index
Last quarter	1.30%	1.37%
1 year	6.32	6.98
3 years	2.77	3.15
5 years	2.31	1.49
10 years	4.65	2.57
Life of fund	6.53	—
Total expense ratio: 0.97%		

Returns for periods of less than one year are not annualized.

*Current performance may be lower or higher than the quoted past performance, which cannot guarantee future results. Share price, principal value, and return will vary, and you may have a gain or a loss when you sell your shares. Performance assumes reinvestment of distributions and does not account for taxes. For the most recent month-end performance, please visit putnam.com. Class Y shares before their inception are derived from the historical performance of class A shares (inception 6/1/87), which have not been adjusted for the lower expenses; had they, returns would have been higher. For a portion of the periods, this fund may have had expense limitations, without which returns would have been lower. Class Y shares are generally only available for corporate and institutional clients and have no initial sales charge.*

The Bloomberg Barclays Global Aggregate Bond Index is an unmanaged index of global investment-grade fixed-income securities. You cannot invest directly in an index.

through at least September 2018, but in reduced monthly amounts. This decision may signal a policy shift by the ECB that will eventually lead to more rapid tapering of its bond-purchase program. In the United Kingdom, the economy appears stable, even as the country is in the midst of Brexit negotiations. In Asia, growth in Japan and China appears to us to be better than investors were anticipating several months ago. In our view, this favorable international backdrop is creating more opportunities to pursue various global interest-rate and currency strategies.

The views and opinions expressed are those of the portfolio managers as of March 31, 2018, are subject to change with market conditions, and are not meant as investment advice. All performance and economic information is historical and is not indicative of future results.

**Consider these risks before investing:** International investing involves currency, economic, and political risks. Emerging-market securities carry illiquidity and volatility risks. Lower-rated bonds may offer higher yields in return for more risk. Funds that invest in government securities are not guaranteed. Mortgage-backed investments carry the risk that they may increase in value when interest rates decline and decline in value when interest rates rise. The fund invests in fewer issuers or concentrates its investments by region or sector, and involves more risk than a more broadly invested fund. The fund's policy of concentrating on a limited group of industries and the fund's non-diversified status, which means the fund may invest in fewer issuers, can increase the fund's vulnerability to common economic forces and may result in greater losses and volatility. Bond investments are subject to interest-rate risk (the risk of bond prices falling if interest rates rise) and credit risk (the risk of an issuer defaulting on interest or principal payments). Interest-rate risk is generally greater for longer-term bonds, and credit risk is generally greater for below-investment-grade bonds. Risks associated with derivatives include increased investment exposure (which may be considered leverage) and, in

the case of over-the-counter instruments, the potential inability to terminate or sell derivatives positions and the potential failure of the other party to the instrument to meet its obligations. Unlike bonds, funds that invest in bonds have fees and expenses. Bond prices may fall or fail to rise over time for several reasons, including general financial market conditions, changing market perceptions (including perceptions about the risk of default and expectations about monetary policy or interest rates), changes in government intervention in the financial markets, and factors related to a specific issuer or industry. These and other factors may lead to periods of high volatility and reduced liquidity in the fund's portfolio holdings. You can lose money by investing in the fund.
